## DETAILED ACTION

### Election/Restrictions

Restriction to one of the following inventions is required under 35 U.S.C 121:

- I. Claims 1 and 3, drawn to a retardation film, classified in class 349, subclass 118.
- II. Claims 2, 4 and 5, drawn to a method of producing the retardation film, classified in class 349, subclass 117.

The invention are distinct, each from the other because of the following reasons:

Inventions I and II are related as subcombinations disclosed as usable together in a single combination. The subcombinations are distinct from each other if they are shown to be separately usable. In the instant case, a retardation film can be prepared by stretching a polymer uniaxially or biaxially, subjecting a polymer to z-axis orientation, or coating a liquid crystal polymer on a base. Invention II has separate utility for producing the retardation film such as forming a film from a photosensitive material, and irradiating the film with a light from a direction inclined with respect to the film surface with optional heating and cooling of the film.

See MPEP § 806.05(d).

Because these inventions are distinct for the reasons given above, and the search required for Invention I is not required for Invention II, restriction for examination purposes as indicated is proper.

Group I or II contains embodiments directed to following patentably distinct species of the claims invention:

A: One embodiment drawn to the first biaxial index ellipsoid having primary refractive indexes satisfy a relationship  $nx \neq ny \neq nz$ , and the second index ellipsoid having primary refractive indexes  $nx'$ ,  $ny'$ ,  $nz'$  obtained by rotating the first index ellipsoid at an arbitrary rotational angle  $\theta_1^\circ$  about the X axis, and at an arbitrary rotational angle  $\theta_2^\circ$  about the Y axis, [fig. 1].

B: Another embodiment drawn to the first biaxial index ellipsoid having primary refractive indexes satisfy a relationship  $nx > ny \geq nz$ , and the second index ellipsoid having primary refractive indexes  $nx'$ ,  $ny'$ ,  $nz'$  obtained by rotating the first index ellipsoid at an arbitrary rotational angle  $\theta_3^\circ$  about the Y axis, and at an arbitrary rotational angle  $\theta_4^\circ$  about the Z axis, [fig. 5].

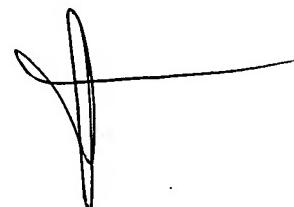

If Invention I is elected, applicant is required under 35 U.S.C. 121 to elect a single disclosed species for prosecution on the merits to which the claims shall be restricted if no generic claim is finally held to be allowable. Currently, none of claims is generic.

Applicant is advised that the reply to this requirement must include an identification of the species that is elected consonant with this requirement, and a listing of all claims readable thereon, including any claims subsequently added. An argument that a claim is allowable or that all claims are generic is considered nonresponsive unless accompanied by an election.

Upon the allowance of generic claim, applicant will be entitled to consideration of claims to additional species which are written in dependent from or otherwise include all the limitations of an allowed generic claim as provided by 37 CFR 1.141. If claims are added after the election, applicant must indicate which are readable upon the elected species. MPEP § 809.02(a).

Should applicant traverse on the ground that the species are not patentably distinct, applicant should submit evidence or identify such evidence now of record showing the species to be obvious variants or clearly admit on the record that this is the case. In either instance, if the examiner finds one of the inventions unpatentable over the prior art, the evidence or admission may be used in a rejection under 35 U.S.C 103(a) of the other invention.

Applicant is advised that the reply to this requirement to be complete must include an election of the invention to be examined even though the requirement be traversed (37 CFR 1.143).
